SELECTED FLOW CHARACTERISTICS OF FLORIDA STREAMS AND CANALS

By Donald W. Foose

ABSTRACT

This report contains data and statistics on low-flow frequency for 254 stream-gaging stations on Florida streams and canals. The selected stations have 10 or more years of continuous record. A site description, a 10-year hydrograph, and a table of flow duration are presented for each station. A computed monthly 7-day, 10-year low flow is presented for stations when flow is not significantly altered by dams, increased or decreased significantly by diversion, or influenced by tides.

INTRODUCTION

The flow of water in streams and canals is not constant. The flow fluctuates naturally because of variations in precipitation and because of man's activities. The effective management of surface waters depends upon a knowledge of the characteristics of the flow in the individual stream or canal. A knowledge of the frequency, duration, and amount of high, low, and sustained flow in the stream is necessary for the design and operation of structures to control the flow of water for municipal, industrial, and irrigation uses; for disposal of sewage and other wastes; for the construction of bridges and highways; and for recreational use.

Purpose and Scope

This report presents statistical summaries of flow duration and low flows at gaging stations in Florida with 10 or more years of record. These summaries provide a common foundation for use in hydrologic investigations and management of surface-water resources, and for administration of laws governing Florida's water resources. It updates a previous report, similar in content and scope, by Heath and Wimberly (1971).

This report contains station descriptions; hydrographs for the latest 10-year period; and duration tables for stream-gaging stations with 10 or more complete years of daily discharge records through October 1979; and for gaging stations where flow is not controlled by dams, increased or decreased significantly by diversion, or influenced by tides. A monthly summary of 7-day, 10-year low flow statistics is also given. An alphabetical listing of stations at the back of this report gives the page number where the station data are found.

Acknowledgments

Appreciation is extended to Martha Thagard of the U.S. Geological Survey in Florida who retrieved the basic data used in this report and who plotted the hydrographs, and to Linda Geiger, also with the Survey in Florida, who determined the monthly 7-day, 10-year low flow statistics.

SELECTION OF DISCHARGE RECORDS

Discharge records, from a network of gaging stations on streams and canals in Florida, have been collected and published by the U.S. Geological Survey on a continuing basis since about 1930. Records for a few stations are available prior to 1930.

Table 1, period of record for selected stations, lists gaging stations in Florida that have 10 or more years of record. The stations are listed in the table in downstream order by hydrologic unit (Conover and Leach, 1975). The list indicates the ranking of streams, with each tributary indented two spaces. Also shown are the years of record for each gaging station. The "X" indicates flow in unaltered streams and the "R" indicates regulated flow.

DATA BY STATION

Station Descriptions

The description of each gaging station includes information that should be considered when using the data. The "location" and "drainage area" were determined by inspection of the site and from U.S. Geological Survey 7.5-minute, 1:24,000 scale, topographic maps. The location is shown by latitude and longitude, by the nearest quarter section within the township and range, by county, by hydrologic unit, and by distance to a nearby town and distance to the mouth of the stream. The "Period of record" shows the periods for which there are published streamflow records. Circumstances that affect flow, such as diversion of water to or from another basin, transfer of water (after use) from a ground-water source to a surface-water source, or from a surface-water source to a ground-water source, or reversed flow caused by wind or tide, or interconnection between basins, are described in "Remarks." When these circumstances so alter the flow that reasonable annual low-flow frequencies could not be determined by Hughes (1981), or for the monthly summary included in this report, that also is noted in "Remarks." "Average discharge" is the mean discharge for the entire period of record. Under "Extremes for period of record," the maximum and minimum discharges and gage heights for the period of record are listed. When a maximum discharge or gage height that predates the period of record has been determined either by direct or indirect measurements, it is listed under a separate heading, "Extremes outside period of record."

Hydrographs

The station description is followed by a plot of monthly mean flow, from October 1969 through September 1979, for stations in operation at the end of water year 1979. For stations not in operation then, the hydrograph is for the final 10 years before the station was discontinued. The flow is termed discharge and is plotted arithmetically for some stations, typically stations with a moderate range of flow and some negative discharge (reverse flow), and logarithmically for other stations. The units of discharge are listed along the ordinate as "Discharge in CFS," (cubic feet per second),

and abbreviated scientific notation. The notations and the equivalent flow in cubic feet per second, currently abbreviated as ft³/s in most U.S. Geological Survey literature, are as follows:

Conversion of hydrograph notation to units of discharge
[Units of discharge in cubic feet per second]

Hydrograph notation	=	Units of discharge
10 ⁻²	=	0.01
10 ⁻¹	=	0.10
10 ⁰	=	1.00
10 ¹	=	10.0
10 ²	=	100
10 ³	=	1,000
10 ⁴	=	10,000

It is characteristic of the log scale used on most of the hydrographs that the zero point is approached but never reached. Streams and canals that have zero flow for long periods have the plot truncated at a point somewhat above the true zero.

Flow Duration

The duration table of daily values statistically separates the daily mean discharge (flow) for the period of record into a maximum of 35 classes. The class limits can be generated by the computer program or selected by the user. When the class limits are generated by the computer program, they are computed from a relation between the lowest positive daily mean flow greater than 0.00 and the second highest daily mean flow value for the period of record. The class limits generated by the computer program range from 0.00 to the second highest value. The maximum flow of record is, therefore, excluded; and all flows lower than the lowest positive nonzero flows, including negative flows, are assigned to class zero which is 0.00 flow. Some 25 stations in this report have significant reverse flow. The class limits for these stations were selected by the author to indicate the extent of these negative flows. A 0.00 point was always included in the limits.

The table gives the percentage of time (PERCT) for the period of record in which the streamflow equaled or exceeded a particular discharge (VALUE). This table is generally used for preparation of a flow-duration curve for the period of record. The table also gives the number of days (TOTAL) in the period of record that discharge equaled or exceeded the class limit of a particular class (CLASS) but was less than the class limit of the next higher class, and the accumulated number of days (ACCUM) in the period of record that discharge equaled or exceeded the class limit of each particular class.

The duration tables in this report represent the entire period of record. Generally, the longer the period used, the more valid the analysis; however, some streams have been substantially altered over time

and it might be better to use a period that represents only the unaltered flow pattern (as in areal studies) or only current conditions. As an example, the Kissimmee River underwent extensive alteration at the station at S-65E near Okeechobee. The duration tables for the years 1929-62 and 1965-80 indicate these changes (table 2):

Most U.S. Geological Survey offices are able to generate the tables for specific sites and specific periods of record.

Low Flows

Following the duration table is a summary of minimum average flows for a 7-day period, by month, that recurs once, on the average, during a 10-year interval. Information on annual low-flow averages for many of the streams in this report are contained in "Low-Flow Frequency Data for Selected Stream-Gaging Stations in Florida" (Hughes, 1981). When flows are extensively controlled or altered, no reasonable monthly or annual 7-day, 10-year low flows can be determined, and that is noted in "Remarks." Data on low-flow frequency are commonly used in determining waste load allocations and water use for industrial, municipal, and agricultural purposes.

The hydrographs and flow-duration tables are computed by water year (October 1 to September 30). The 1979 water year, for example, began on October 1, 1978, and ended on September 30, 1979.

The duration table, however, only lists the number of days that flow equaled or exceeded a class value without reference to time. The hydrograph indicates variation of flow over time but does not indicate statistical data. Together, the duration table or curve and the hydrograph present a more complete picture of flow for a site.

The seasonable distribution of rainfall for peninsular Florida differs appreciably from that for the northern part of the State and for adjacent states. Because of the difference in the pattern of rainfall, streams that originate in Alabama and Georgia and flow south into Florida tend to have high flows in the spring months and low flows in the fall (see Ochlockonee River near Havana, p. 230; or Suwannee River at Branford, p. 213); and streams in peninsular Florida tend to have high flows in the fall (St. Johns River near Christmas, p. 26; or Fisheating Creek at Palmdale, p. 65). Hughes (1981), in computing annual low-flow frequencies for Florida streams, used a climatic year ending March 31 for north Florida streams and a climatic year ending June 30 for south Florida streams.

TECHNIQUE FOR CONSTRUCTING FLOW-DURATION CURVES

The flow-duration curve is a cumulative frequency curve that shows the percentage of time that specified discharges were equaled or exceeded for a given period. The curve is a means of showing the flow characteristics of a stream throughout the range of discharge. A flow-duration curve (Searcy, 1959) can be constructed from the flow-duration summary by plotting the discharges (VALUE) as ordinates and the percentages (PERCT) as abscissas, usually on a log-probability graph. Smooth curves are usually drawn to fit the plotted points, but straight lines could be used to connect the points to avoid introducing interpretations.

The shape of a duration curve reflects the topographic, hydrologic, and geologic characteristics of the drainage area above the gaging site. Searcy states that a curve with a steep slope throughout, such as that for Peace River at Arcadia, Fla., as shown in figure 1, denotes a stream whose flow is highly variable and largely from direct runoff. A curve with a flat slope, such as that for Econfina Creek near Bennett, Fla., also shown in figure 1, indicates that the flow is relatively stable and often derived from surface- or ground-water storage (Searcy, 1959).

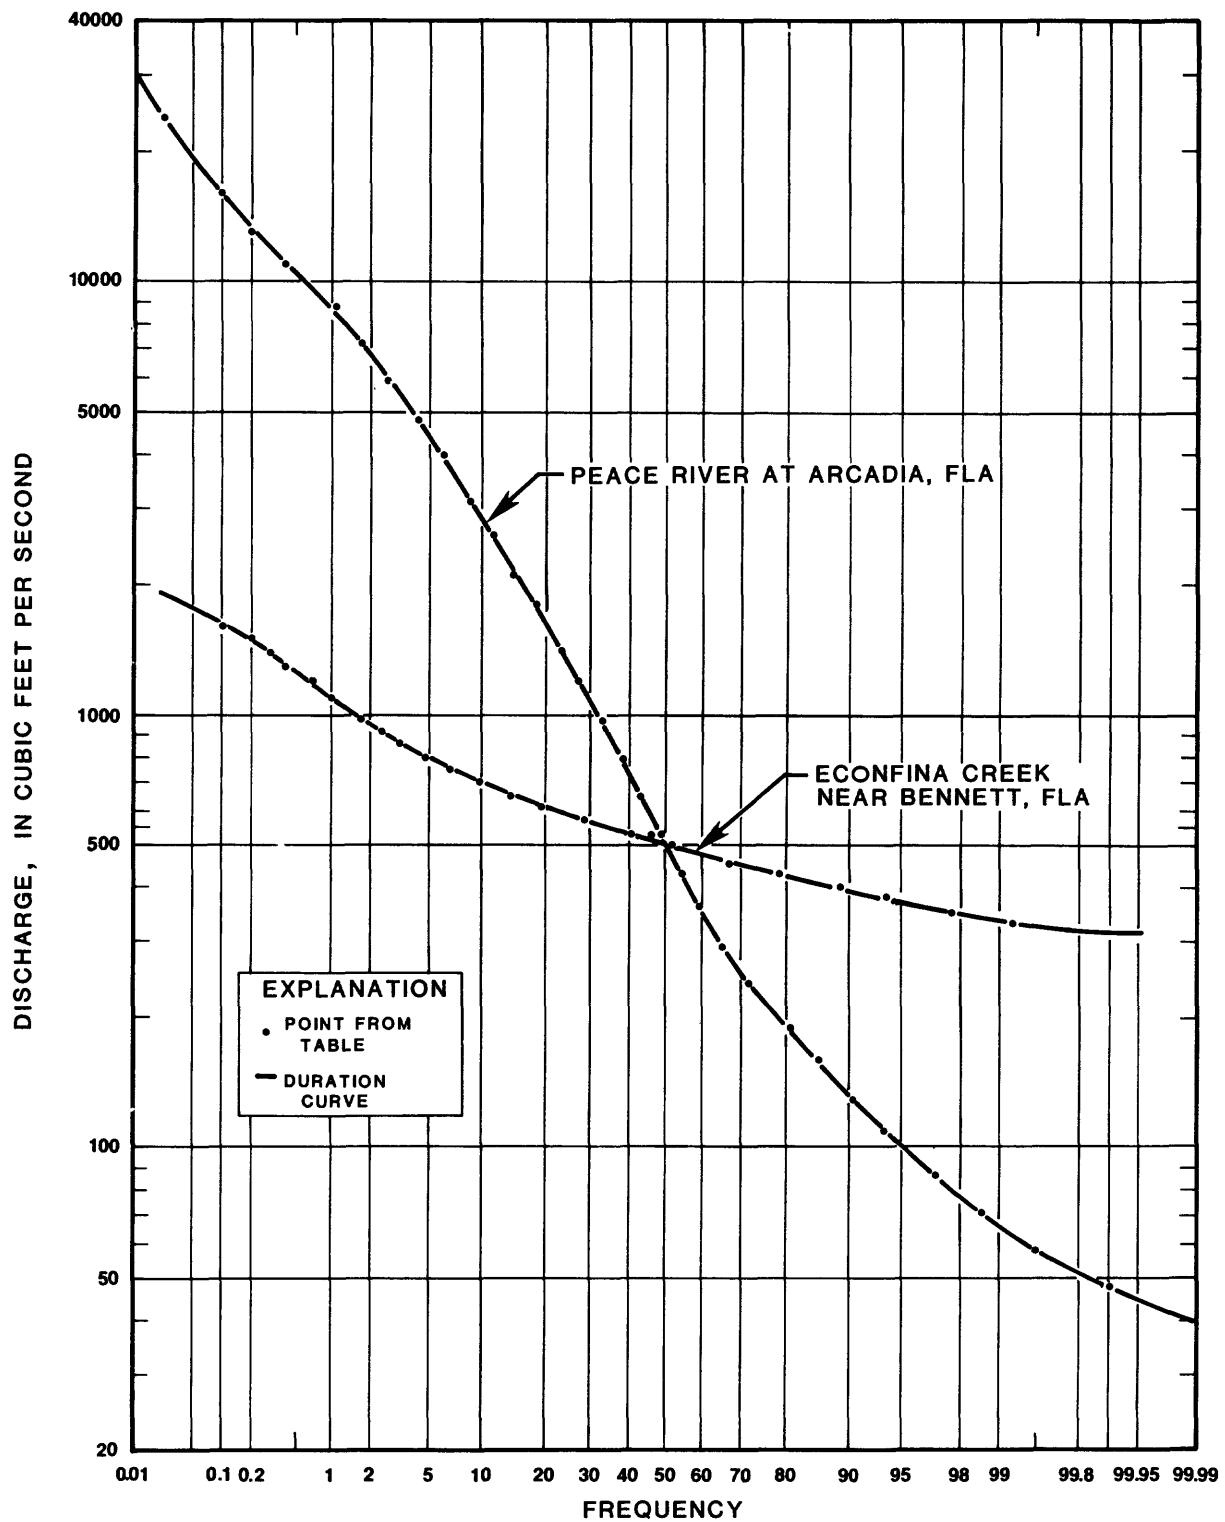

Figure 1.— Duration curves for representative streams in Florida.

The duration curve for Peace River at Arcadia (fig. 1) shows that a daily discharge of 100 cubic feet per second was exceeded or equaled 95 percent of the days and 4,400 cubic feet per second was exceeded or equaled 5 percent of the days for the period of record (1931-79).

The duration curve for Econfina Creek near Bennett (fig. 1) shows that a daily discharge of 370 cubic feet per second was exceeded or equaled 95 percent of the days and 790 cubic feet per second was exceeded or equaled 5 percent of the days for the period of record (1935-79). The duration curve also shows that the median discharge (when the daily discharge was equaled or exceeded 50 percent of the days) was 500 cubic feet per second for both sites.

LOCATION.--Lat 28°35'33", long 81°49'21", in NE $\frac{1}{4}$ sec.8, T.22 S., R.25 E., Lake County, Hydrologic Unit 03080102, 21 ft (6 m) upstream from spillway at outlet of Cherry Lake, 3 mi (5 km) northeast of Groveland, and 116 mi (187 km) upstream from mouth.

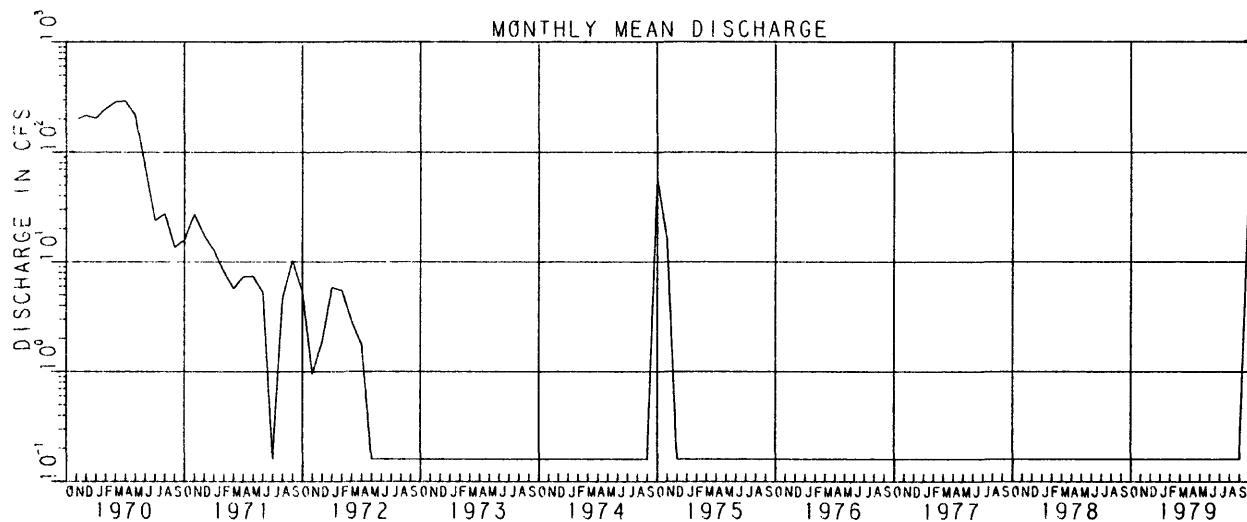

DRAINAGE AREA.--165 mi² (427 km²).

PERIOD OF RECORD.-- March 1957 to September 1979.

REMARKS.--Flow regulated by earthen dam and concrete spillway with radial lift gates at outlet. An undetermined amount of water is diverted at times through a gated culvert in dam for irrigation of citrus groves. Because of extensive regulation and diversion, no low-flow data contained in Hughes (1981), or listed below.

AVERAGE DISCHARGE.--21 years (water years 1958-78), 44.2 ft³/s (1.252 m³/s), 3.64 in/yr (92 mm/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum daily discharge, 584 ft³/s (16.5 m³/s) Apr. 5, 1960; maximum daily reverse flow, 5.1 ft³/s (0.14 m³/s) July 14, 1971; no flow for many days in most years.

02278000 WEST PALM BEACH CANAL AT HGS-5, AT CANAL POINT, FL

LOCATION.--Lat 26°51'5 long 80°37'55", in NE sec.33, T.41 S.; R.37 E.; Palm Beach County Hydrologic Unit 03090202, in hurricane gate structure 5 at Lake Okeechobee, 200 ft (61 m) upstream from bridge on U.S. Highway 441 at Canal Point.

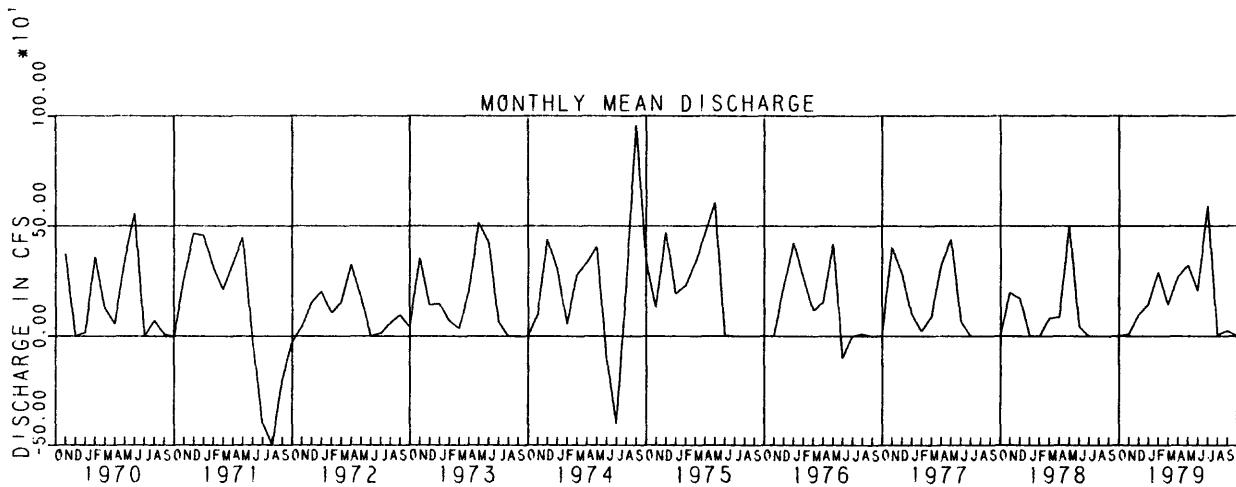

DRAINAGE AREA.--Indeterminate.

PERIOD OF RECORD.--November 1939 to September 1979.

REMARKS.--Flow regulated at station by operation of hurricane gates. Flow occasionally reversed after periods of considerable rainfall because of downstream natural drainage and pumpage from agricultural lands in the Everglades (negative figures indicate flow reversed). No low-flow data contained in Hughes (1981), or listed below.

AVERAGE DISCHARGE.--39 years (water years 1941-79), 168 ft³/s (4.76 m³/s), 121,600 acre-ft/yr (150 hm³/yr).

EXTREMES FOR PERIOD OF RECORD: Maximum daily discharge, 1,610 ft³/s (45.6 m³/s) Oct. 2, 1959; maximum daily reverse flow, 1,760 ft³/s (49.8 m³/s) June 15, 1942.

02278450 WEST PALM BEACH CANAL ABOVE S-5A, NEAR LOXAHATCHEE, FL

LOCATION.--Lat 26°41'05", long 80°22'15", in SW₁ sec.32, T.43 S.; R.43 E.; Palm Beach County, Hydrologic Unit 03090202, 500 ft (152 m) upstream from pump station S-5A, 0.3 mi (0.5 km) upstream from Levee 8 Canal, 1.1 mi (1.8 km) downstream from bridge on U.S. Highway 441 and Cross Canal, and 6 mi (10 km) west of Loxahatchee.

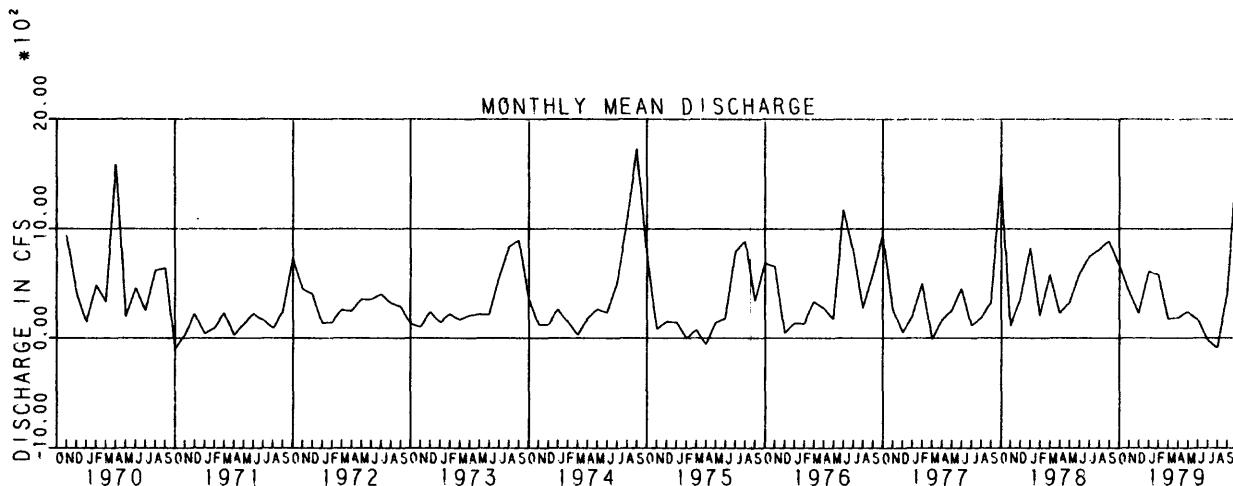

DRAINAGE AREA.--Indeterminate.

PERIOD OF RECORD.--October 1957 to September 1979.

REMARKS.--Flow regulated primarily by pumpage at S-5A and to a lesser extent by operation of control structure 5A-W. Major regulation above the station occurs in Cross Canal, 1.5 mi (2.4 km) upstream, and at hurricane gate structure 5 at Lake Okeechobee, 20 mi (32 km) upstream. Discharge is the difference between pumpage at S-5A and gate discharge at S-5A-W. Negative figures indicate flow to the west. See records on diversions to Conservation Area No. 1 at S-5A, near Loxahatchee (station 02278500; pump station S-5A, upper), for table of daily gage height. No low-flow data contained Hughes (1981), or listed below.

AVERAGE DISCHARGE.--22 years, 440 ft³/s (12.5 m³/s), 318,500 acre-ft/yr (393 hm³/yr).

EXTREMES FOR PERIOD OF RECORD: Maximum daily discharge, 5,230 ft³/s (148 m³/s) Mar. 27, 1970; maximum daily reverse flow, 775 ft³/s (22.0 m³/s) Oct. 26, 1968.

DRAINAGE AREA.--Indeterminate.

PERIOD OF RECORD.--October 1957 to September 1979.

REMARKS.--Normal flow is considered as that to the south into Conservation Area No. 1. Flow is controlled by S-5A pumping, syphoning and regulation of Cross Canal, 1.5 mi (2.4 km) upstream, and hurricane gate structure 5, 20 mi (32 km) upstream. Negative figures indicate releases from gate S-5A-S. No low-flow data contained in Hughes (1981), or listed below.

02279000 WEST PALM BEACH CANAL AT WEST PALM BEACH, FL

LOCATION.--Lat 26°38'40", long 80°03'24", in NE⁴ sec.16, T.44 S., R.43 E., Palm Beach County, Hydrologic Unit 03090202, at lock and control structure, 20 ft (6.1 m) upstream from bridge on U.S. Highway 1, and 4.9 mi (7.9 km) south of courthouse in West Palm Beach.

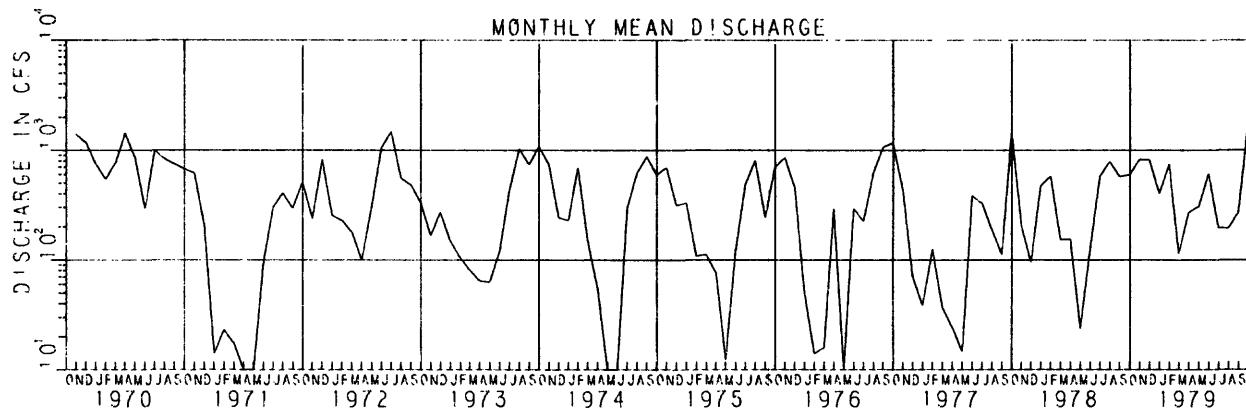

DRAINAGE AREA.--Indeterminate.

PERIOD OF RECORD.--November 1939 to September 1979.

REMARKS.--Flow regulated by operation of control structure and gates in lock chamber for irrigation and drainage purposes. Lock chamber not used for navigation. Since January 1954, flow affected by control structures 20 mi (32 km) upstream. No low-flow data contained in Hughes (1981), or listed below.

AVERAGE DISCHARGE.--39 years (water years 1941-79), 746 ft³/s (21.1 m³/s), 540,100 acre-ft/yr (666 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum daily discharge, 5,320 ft³/s (151 m³/s) Apr. 18, 1942; flow consists of leakage estimated as 10 ft³/s (0.28 m³/s) for many days in 1967-1977.

EXTREMES OUTSIDE PERIOD OF RECORD.--Flood of Oct. 23, 24, 1924 had a discharge 8,570 ft³/s (243 m³/s).

02283498 NORTH NEW RIVER CANAL AT S-2 AND HGS-4, NEAR SOUTH BAY, FL

LOCATION.--Lat 26°42'00", long 80°42'55", in SW 1/4 sec.35, T.43 S., R.36 E., Palm Beach County, Hydrologic Unit 03090202, at pump station 2 and hurricane gate structure 4,500 ft (153 m) upstream from Hillsboro Canal, and 2.7 miles (4.3 km) north of South Bay.

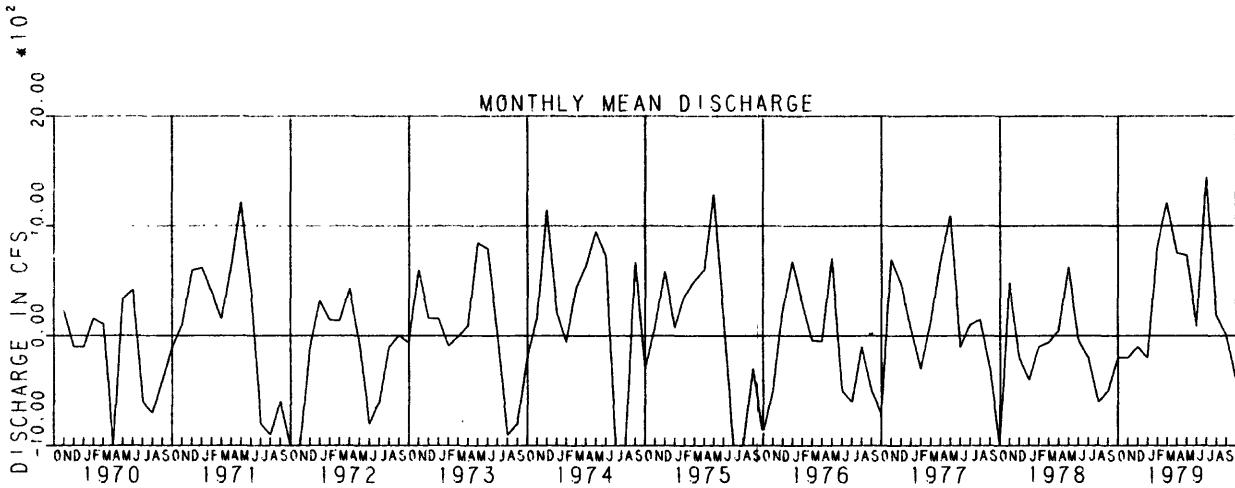

DRAINAGE AREA.--Indeterminate.

PERIOD OF RECORD.--October 1967 to September 1979.

REMARKS.--Flow regulated by hurricane gates and pump station at Lake Okeechobee. Discharge is summation of HGS-4 flow and S-2 pumpage. Flow frequently reversed during and after periods of heavy rainfall by pumpage into the canal from agricultural lands in the Everglades or by the operation of pump station No. 2. Negative discharges treated as zero values. No low-flow data contained in Hughes (1981), or listed below.

AVERAGE DISCHARGE.--12 years, 3.67 ft³/s (0.10 m³/s), 2,657 acre-ft/yr (3.28 hm³/yr).

EXTREMES FOR PEIORD OF RECORD.--Maximum daily discharge, 2,680 ft³/s (75.9 m³/s) Jan. 28, 1979; maximum daily reverse flow 3,910 ft³/s (111 m³/s) July 23, 1973; no flow for some days each year.

EVERGLADES AND SOUTHEASTERN COASTAL AREA

02286100 SOUTH NEW RIVER CANAL AT S-13, NEAR DAVIE, FL

LOCATION.--Lat 26°03'57", long 80°12'32", in SW₁ sec.25, T.50 S., R.41 E., Broward County, Hydrologic Unit 03090202, 150 ft (46 m) upstream from pump station 13, 300 ft (91 m) west of U.S. Highway 441, and 1.5 mi (2.4 km) east of Davie.

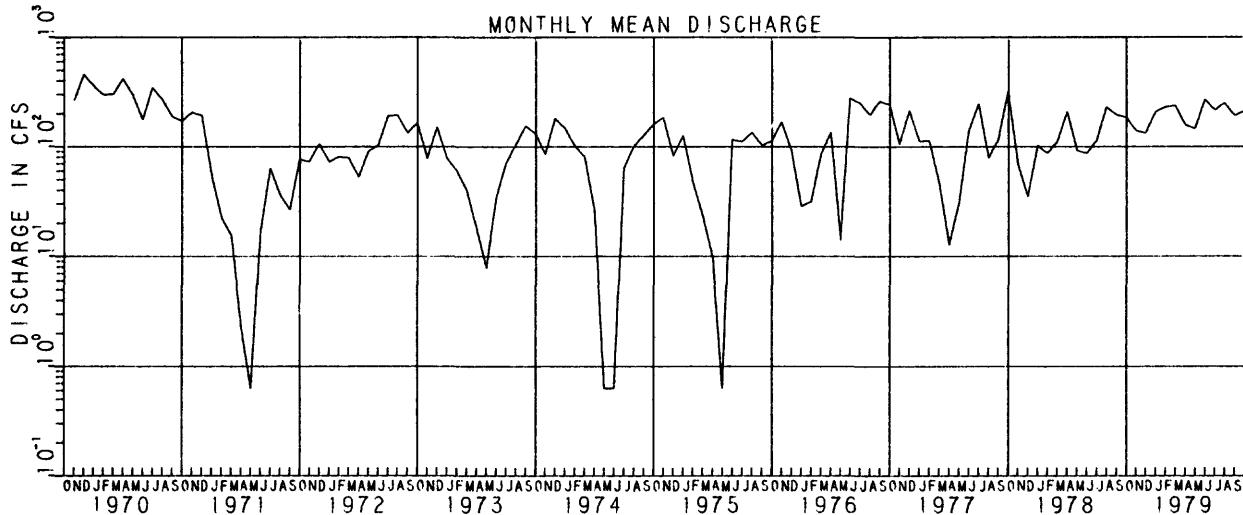

DRAINAGE AREA.--Indeterminate.

PERIOD OF RECORD.--March 1957 to September 1979.

REMARKS.--Flow is affected by tide and is occasionally reversed. Negative figures indicate reverse flow. Flow is regulated by pumpage and operation of gate at S-13. Flow is affected by regulation of control-structure 13A 5 mi (8 km) upstream and by upstream withdrawals from the canal during the growing season and pumpage into the canal during high water. No low-flow data contained in Hughes (1981), or listed below.

AVERAGE DISCHARGE.--21 years, 175 ft³/s (4.96 m³/s), 126,700 acre-ft/yr (156 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 1,050 ft³/s (29.7 m³/s) Jan. 25, 1963 and Oct. 12, 1964; maximum reverse flow, 657 ft³/s (18.6 m³/s) Sept. 12, 1962; no flow for some days in most years.

PERIOD OF RECORD.--November 1939 to September 1963.

REMARKS.--Discharge consist of runoff from the Everglades as represented by flow through all outlets of Tamiami Canal from Monroe, 55 miles (88 km) west of Miami, to point 18 miles (29 km) west of Miami, where a levee aids in diverting flow southward. Since July 1952, flow affected by extensive levee and control works to the north for agricultural and flood control purposes. Negative discharges treated as zero values. No low-flow data contained in Hughes (1981), or listed below.

EXTREMES FOR PERIOD OF RECORD.--Maximum daily discharge, 17,000 ft³/s (481 m³/s) Oct. 12, 1947; maximum daily reverse flow, 2.0 ft³/s (0.06 m³/s) May 1-10, 1949; no flow for several days in some years.

LOCATION.--Lat 28°01'25", long 82°25'40", in NW 1 sec. 29, T. 28 S., R. 19 E., Hillsborough County, Hydrologic Unit 03100205, at upstream side of control structure for Tampa Reservoir, at 30th Street, 5.4 mi (8.7 km) northeast of Tampa, and 10 mi (16 km) upstream from mouth.

DRAINAGE AREA.--650 mi² (1,700 km²), approximately.

PERIOD OF RECORD.--October 1938 to September 1979.

REMARKS.--Flow regulated at station since Oct. 1, 1945, by manipulation of radial gates in spillways and on dam by city of Tampa Water Department. Capacity of reservoir insufficient to affect monthly figures of runoff. Some diversions at times by pumping from Sulphur Springs at Sulphur Springs into reservoir and at point 1.3 mi (2.1 km) above station for water supply by city of Tampa. An appreciable amount of discharge is diverted from basin into Tampa Bypass Canal during May, August, and September. No low-flow data contained in Hughes (1981), or listed below.

AVERAGE DISCHARGE.--40 years (water years 1939-78), 593 ft³/s (16.79 m³/s), 12.39 in/yr (315 mm/yr), 429,600 acre-ft/yr (530 hm³/yr), adjusted for diversion.

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 14,600 ft³/s (413 m³/s) Mar. 21, 1960; no flow Nov. 30 to Dec. 2, 1945.EXTREMES OUTSIDE PEIORD OF RECORD.--A discharge of 16,500 ft³/s (467 m³/s) was measured Sept. 9, 1933.

REMARKS.--Records are for flow of main channel only, which normally includes all the flow. Some interconnection with Gator Creek and some diversions to the north probably exist during periods of extreme high water.

AVERAGE DISCHARGE.--12 years, 147 ft³/s (4.163 m³/s), 106,500 acre-ft/yr (131 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 1,840 ft³/s (52.1 m³/s) Sept. 30, 1974; no flow for many days in most years; river dry at gage for many days in some years.

LOCATION.--Lat 28°49'01", long 82°08'40", in SE $\frac{1}{4}$ sec.19, T.19 S., R.22 E., Sumter County, Hydrologic Unit 03100208, 0.8 mi (1.3 km) north of outlet, 1.3 mi (2.1 km) north of Panacoochee Retreats, 2.0 mi (3.2 km) upstream from mouth, and 5.1 mi (8.2 km) northwest of town of Lake Panasoffkee.

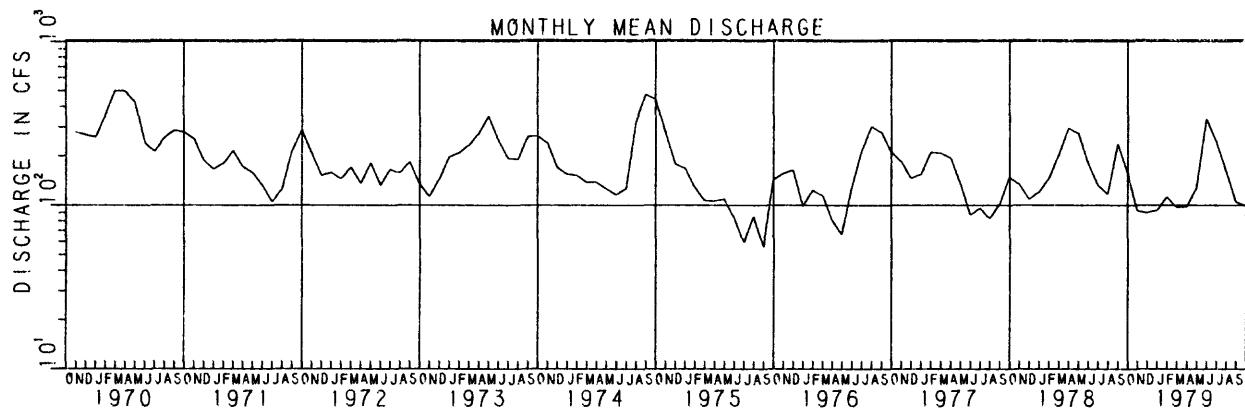

DRAINAGE AREA.--420 mi² (1,090 km²), approximately.

PERIOD OF RECORD.--October 1962 to September 1979.

REMARKS.-- Flow partially controlled at times by backwater from Withlacochee River. Prior to 1962, flow partially controlled by small rock dams and at times during 1962-64 by a temporary sheet piling dam about 400 ft (120 m) downstream from bridge on State Highway 470.

AVERAGE DISCHARGE.--17 years, 190 ft³/s (5.381 m³/s), 6.14 in/yr (156 mm/yr), 137,700 acre-ft/yr (170 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum daily discharge, 538 ft³/s (15.2 m³/s) Aug. 12, 13, 1965; no flow June 27 to July 15, 1963, temporary dam in place.

WITHLACOOCHEE RIVER BASIN

02313230 WITHLACOOCHEE RIVER AT INGLIS DAM, NEAR DUNNELLON, FL

LOCATION.--Lat 29°00'35", long 82°37'01", in SW $\frac{1}{4}$ sec.8, T.17 S., R.17 E., Levy County, Hydrologic Unit 03100208, at control structure of Inglis Dam, 3.5 mi (5.6 km) southeast of Inglis, 9.8 mi (15.8 km) west of Dunnellon, and 11 mi (18 km) upstream from mouth.

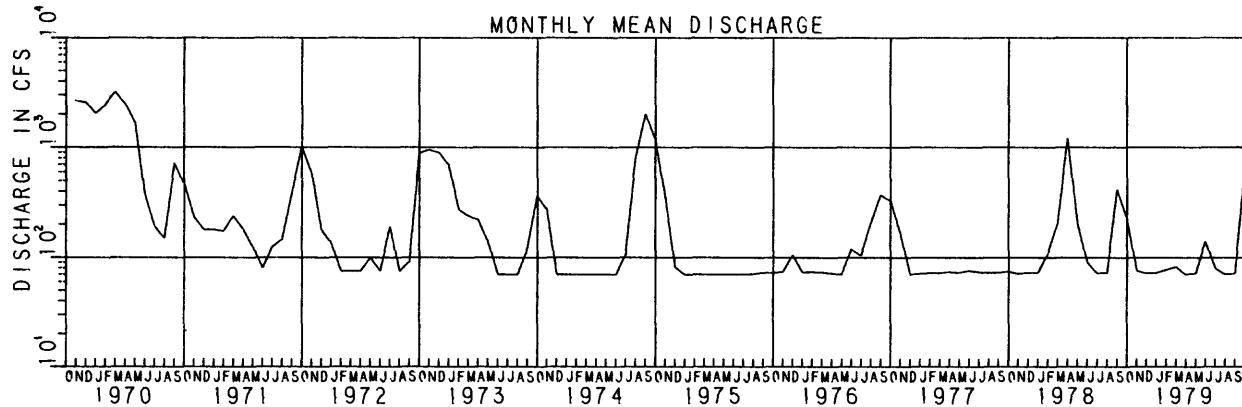

DRAINAGE AREA.--2,020 mi² (5,230 km²), approximately.

PERIOD OF RECORD.--October 1969 to September 1979.

REMARKS.--Records include flow of springs, approximately 70 ft³/s (1.98 m³/s), just downstream from control structure; spring flow is considered to be mostly leakage from Lake Rousseau. Flow regulated by manipulation of gates in spillway. Since December 1969, entire flow diverted below station from old river channel into Cross-Florida Barge Canal, and diversions above station from Lake Rousseau, for boat lockages, through Cross-Florida Barge Canal, for maintaining flow in old river channel, through Withlacoochee River Bypass Channel. No low-flow data contained in Hughes (1981). or listed below.

AVERAGE DISCHARGE.--10 years, 347 ft³/s (9.827 m³/s), 251,400 acre-ft/yr (310 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge measured, 3,980 ft³/s (113 m³/s) July 26, 1966; gates closed and flow consists of leakage, about 70 ft³/s (1.98 m³/s) for all or part of some days in most years.
